

Moniskaalaiset energiajärjestelmämallit pääöksenteon tukena

**21.11.2019, FORS
Juha Kiviluoma, erikoistutkija**

	Decisions	Actors	Responsibility
Years	Investments	Market actors	Regulator
Months	Hydro planning	Producers	-
Days	Day-ahead market	Market actors	Market operator
Hours	Intra-day markets	Market actors	Market operator
Minutes	Balancing market	Market actors	System operator
Seconds	Manual reserves	Market actors, providers	System operator
Seconds	Automatic reserves	Reserve providers	System operator
Now	Inertia	Reserve providers	System operator

There are lots of models

- Physics
 - Power: transient stability, dynamic stability
 - Gas: linepack
 - Heat: thermal simulations
 - Industries: process specific models
- Operational
 - Power: unit commitment with power flows
 - Heat: thermal simulations
 - Industries: control software
 - Transport: dynamic simulations
- Planning
 - Power and gas: investment models, macro-economic models
 - Heat: Building stock models
 - Transport: transport sector models

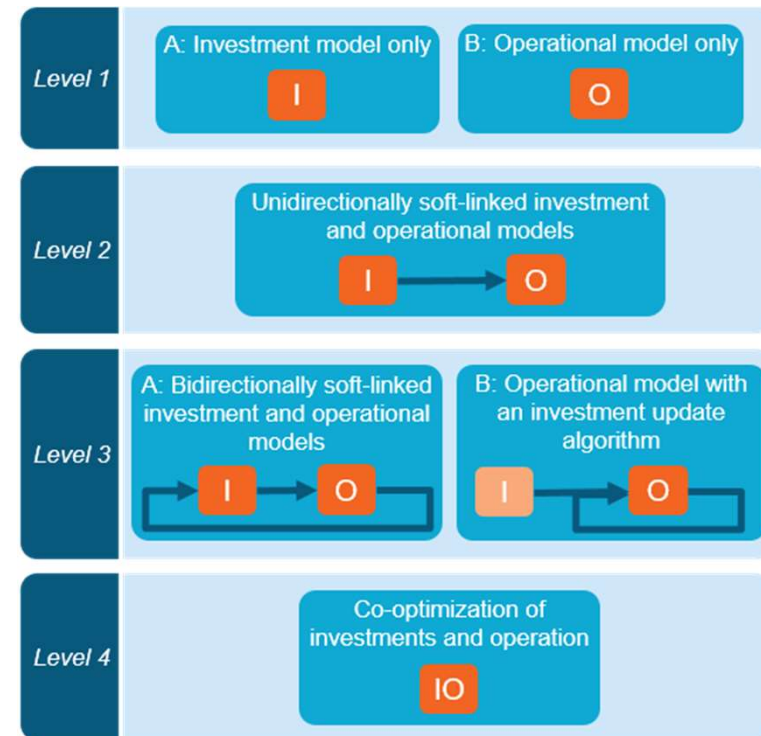

New challenges generated by 'VIBRES'

Holttinen et al.
submitted

Approaches to the multiscale problem

- Each works on their own
 - Results and lessons diffuse over time
 - Approximations at higher level models
- Soft-link models
 - Results get passed between independent models either one-way or as iteration
- Co-optimization
 - Simplifications required

Helistö et al. "Including operational aspects in the planning of power systems with large amounts of variable generation: A review of modeling approaches", *WIREs Energy Environ.* 2019

Manage modelling with Spine Toolbox

Juha Kiviluoma

Senior scientist, VTT Technical Research Centre of Finland

Senior energy systems researcher, University College Dublin

OpenMod workshop

KU LEUVEN

ENERGY REFORM
CONSULTING SERVICES

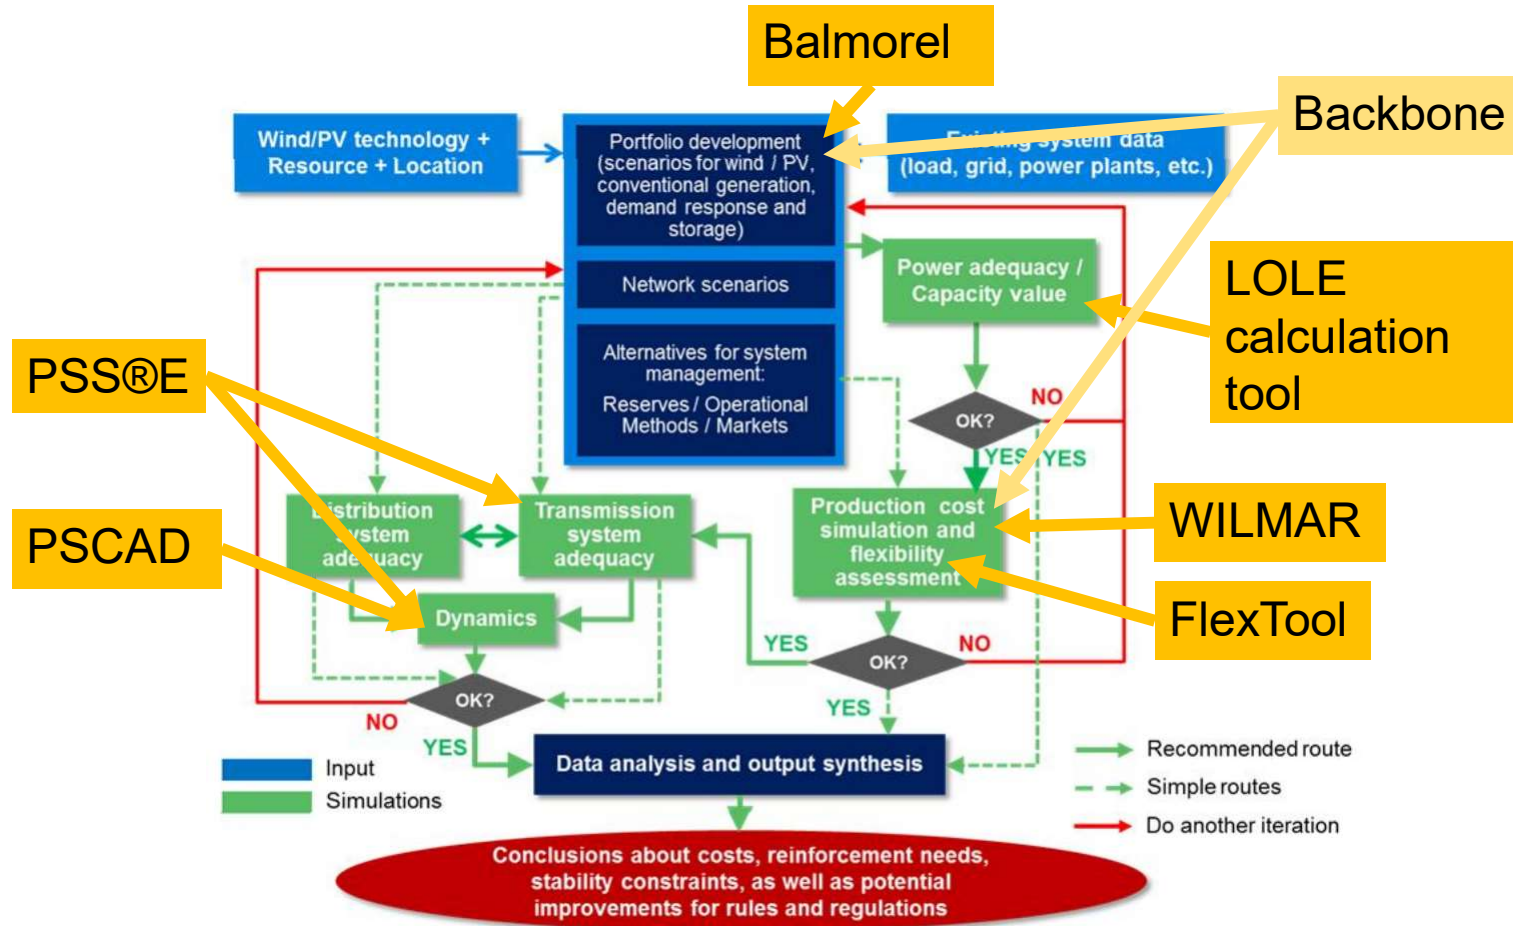

Starting points

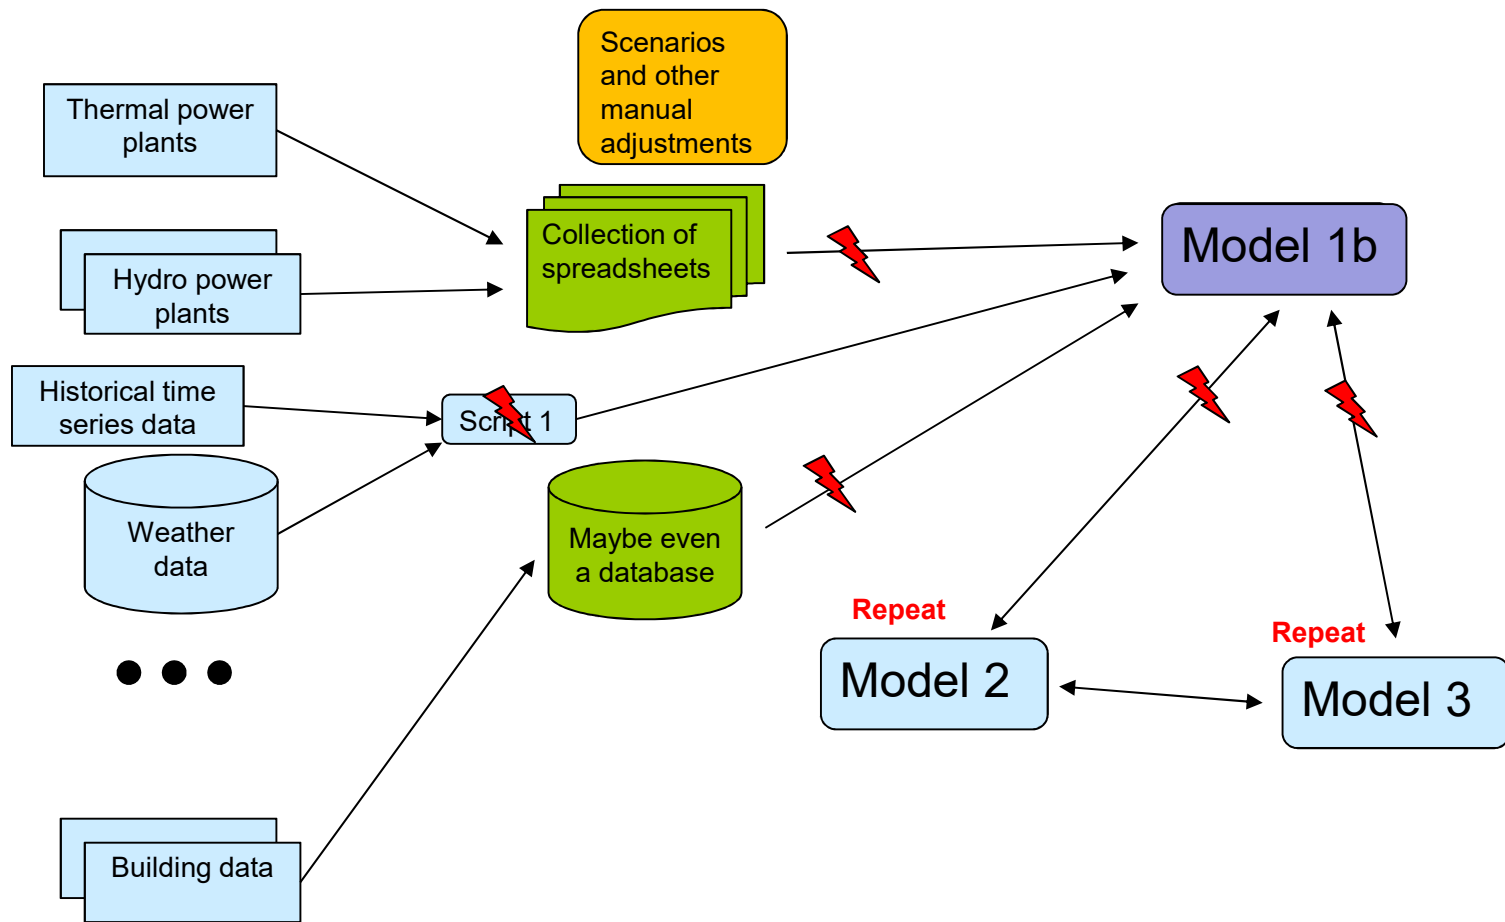

- Some aims
 - Co-operation instead of competition
 - Build tools together
 - Replicable results → scientific progress and more reliable policy support
- Some means
 - Open source
 - Python based Spine Toolbox

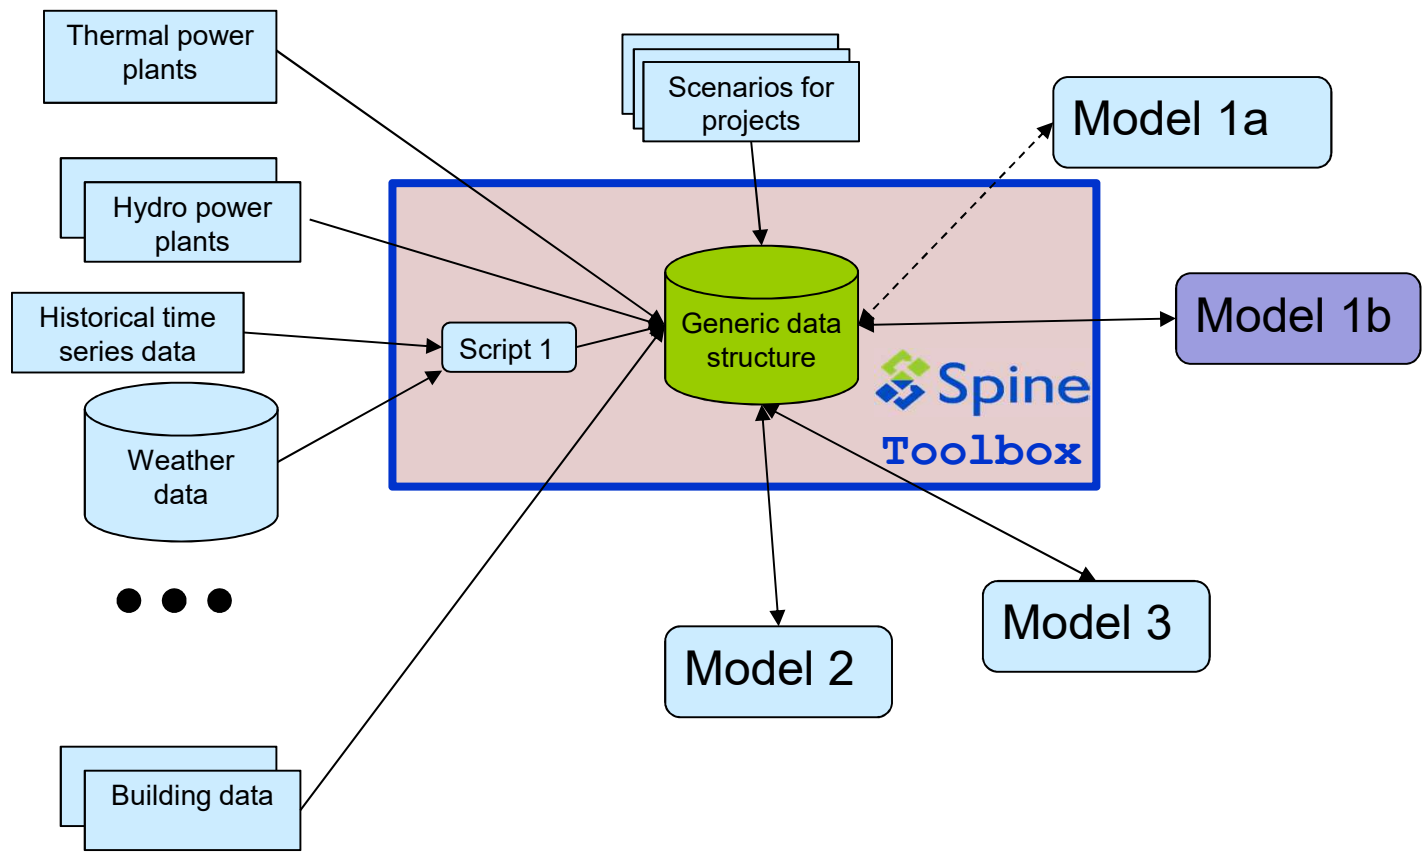

- Spine Model in Julia (<https://github.com/Spine-project>)
- Backbone in GAMS (<https://gitlab.vtt.fi/backbone>)
- IRENA FlexTool in Excel/Mathprog (<https://www.irena.org/energytransition/Energy-System-Models-and-Data/IRENA-FlexTool>)

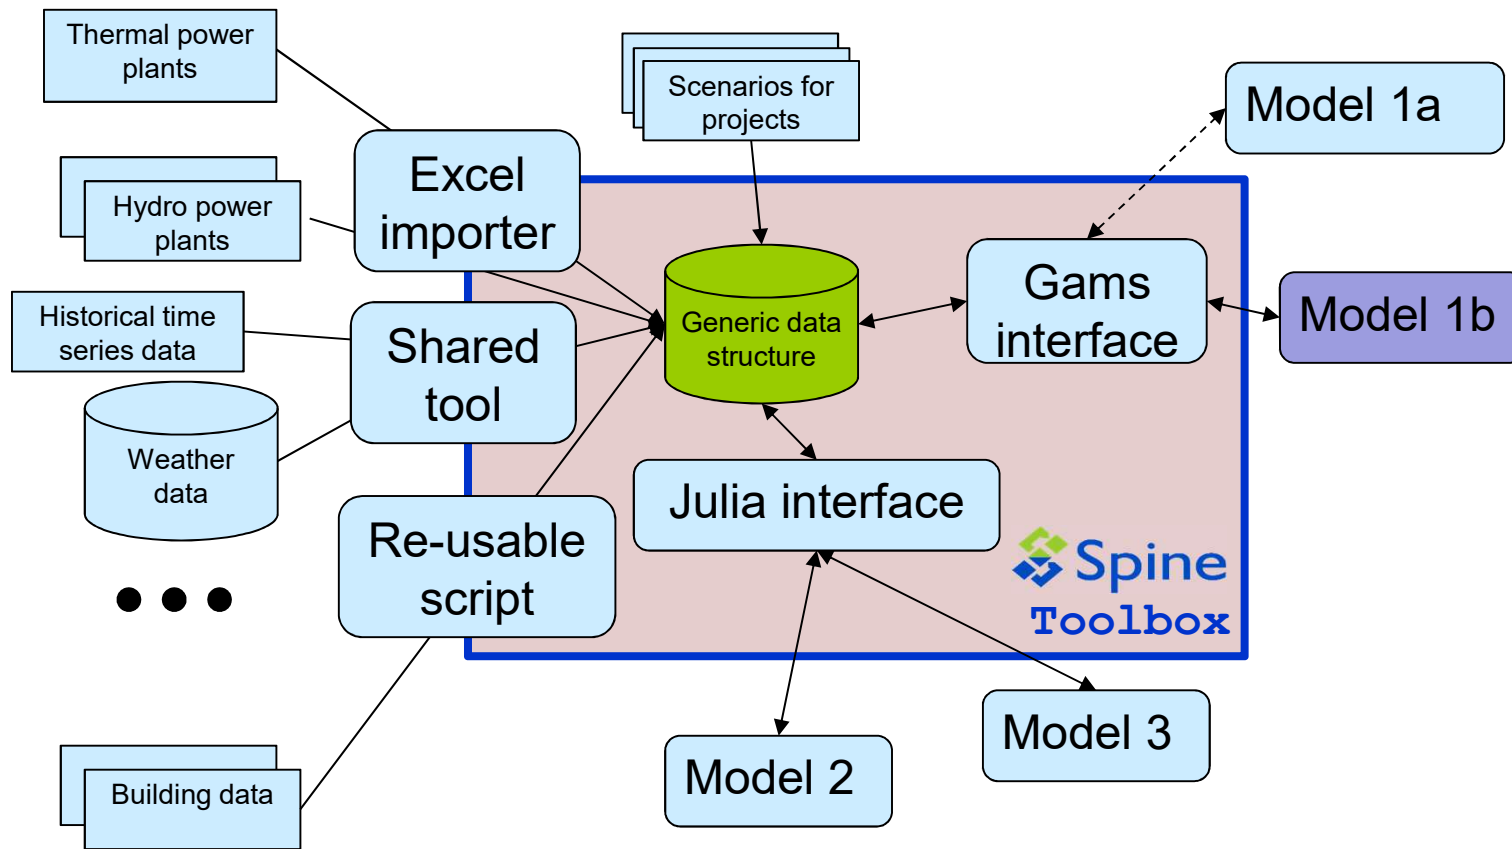

Design and Operation of Energy Systems models

Spine

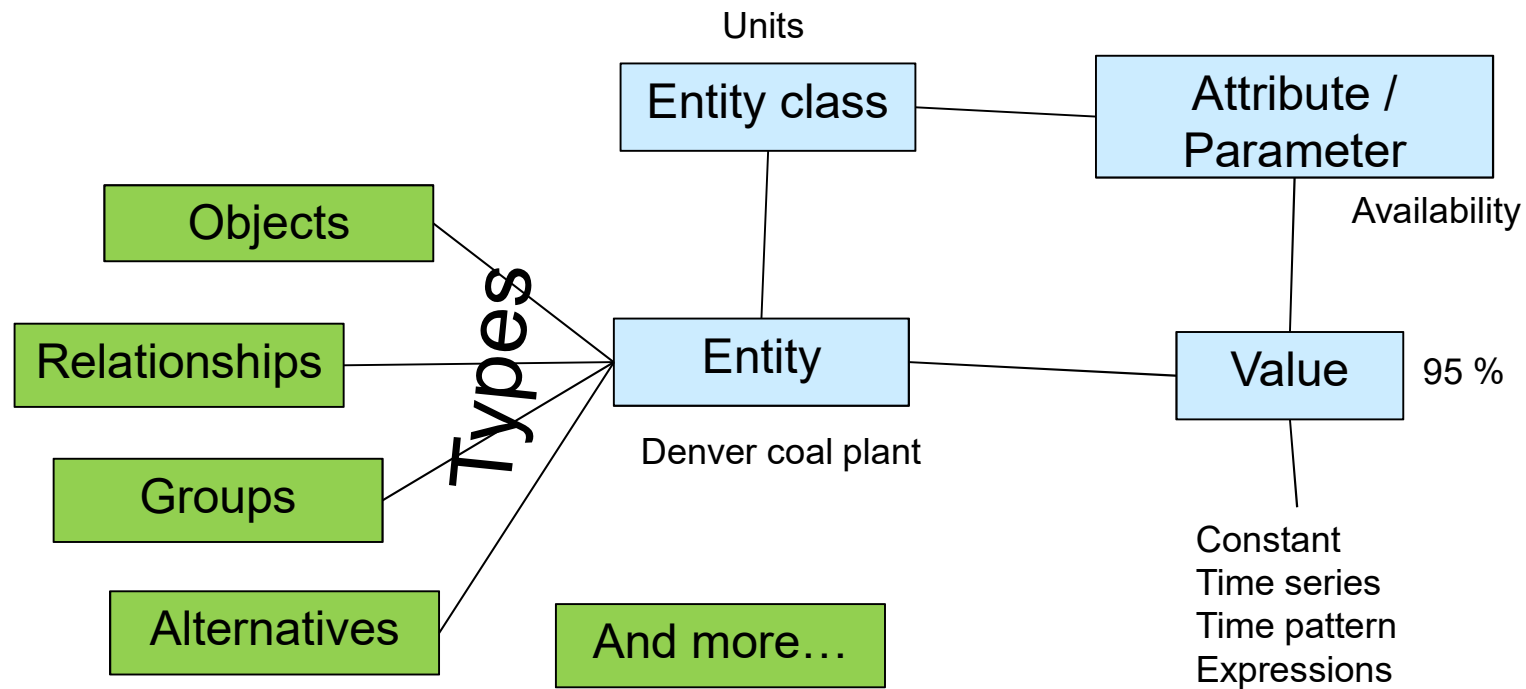

Remedies

- Interface!
 - Connect through a shared, generic, data structure
 - Each tool needs to maintain only one connection
 - Easy to add new tools and swap old tools
- Non-documented spreadsheets → Re-usable scripts
- Local files → Server based databases (one version)
- Version control (know what happened) and open source (share the effort)
 - Data acquisition and data processing
 - Models
- Project based workflow
 - Keep project specific modifications separate
- Separate design and execution
 - Work on your laptop, execute in cloud

Generic data structure (EAV with classes and entity types)

Alternatives, scenarios and recipes

- Establish workflows
 - Common workflow language
- Separate design and execution
 - Spine Toolbox for design
 - Spine Engine for execution
 - Direct acyclic graphs
 - Scheduling, workers,...

Spine: Open source toolbox for modelling ~~integrated energy systems~~

- Project part funded by the Horizon 2020 program of the European Union
- LCE-05-2017 - Tools and technologies for coordination and integration of the European energy system
- 4 year project commenced October 2017 with a €3.7m budget
- 5 Partners, collaboration with NREL & DTU

Power to space heating

- Heat pumps often profitable already
 - Challenge: Heat source
 - Opportunity: Boreholes
- Resistance heating is cheap
 - Can rapidly replace fuel fully or partially
 - If electricity grids can take it
- Inflexible electric heating
 - Problem for power system
 - Heat is inexpensive to store – especially in new builds
 - Maybe even more important than energy efficiency in buildings

EU-28 heating and cooling in final energy use

Power to industries

- Processes are diverse
- Heat pumps can do only so much
- Direct conversion can yield high temperatures
- ...but portion of the processes are difficult to electrify

- Biggest barrier is price
- Fossil fuels are cheap in heating
- ...but 2035 goals

T. Naegler, S. Simon, M. Klein, H. C. Gils, "Quantification of the European industrial heat demand by branch and temperature level"

Power to molecules

- Part of energy demand in industries
- Raw materials (molecules) for some industries
- Power to fuels

Power to transport

- Electric vehicles
- Some forms of transport are difficult to electrify

Challenges and opportunities

- Don't waste electricity
- Distribution grids
- Large amounts of wind power and the transmission grid
- Heating of buildings
- Opportunities
 - Power to heat
 - Power to molecules
 - Smart utilization of the biomass resources
- Challenges
 - Stranded assets (electricity, heat, transport)
 - Peak capacity
 - Power system stability

Types of entities

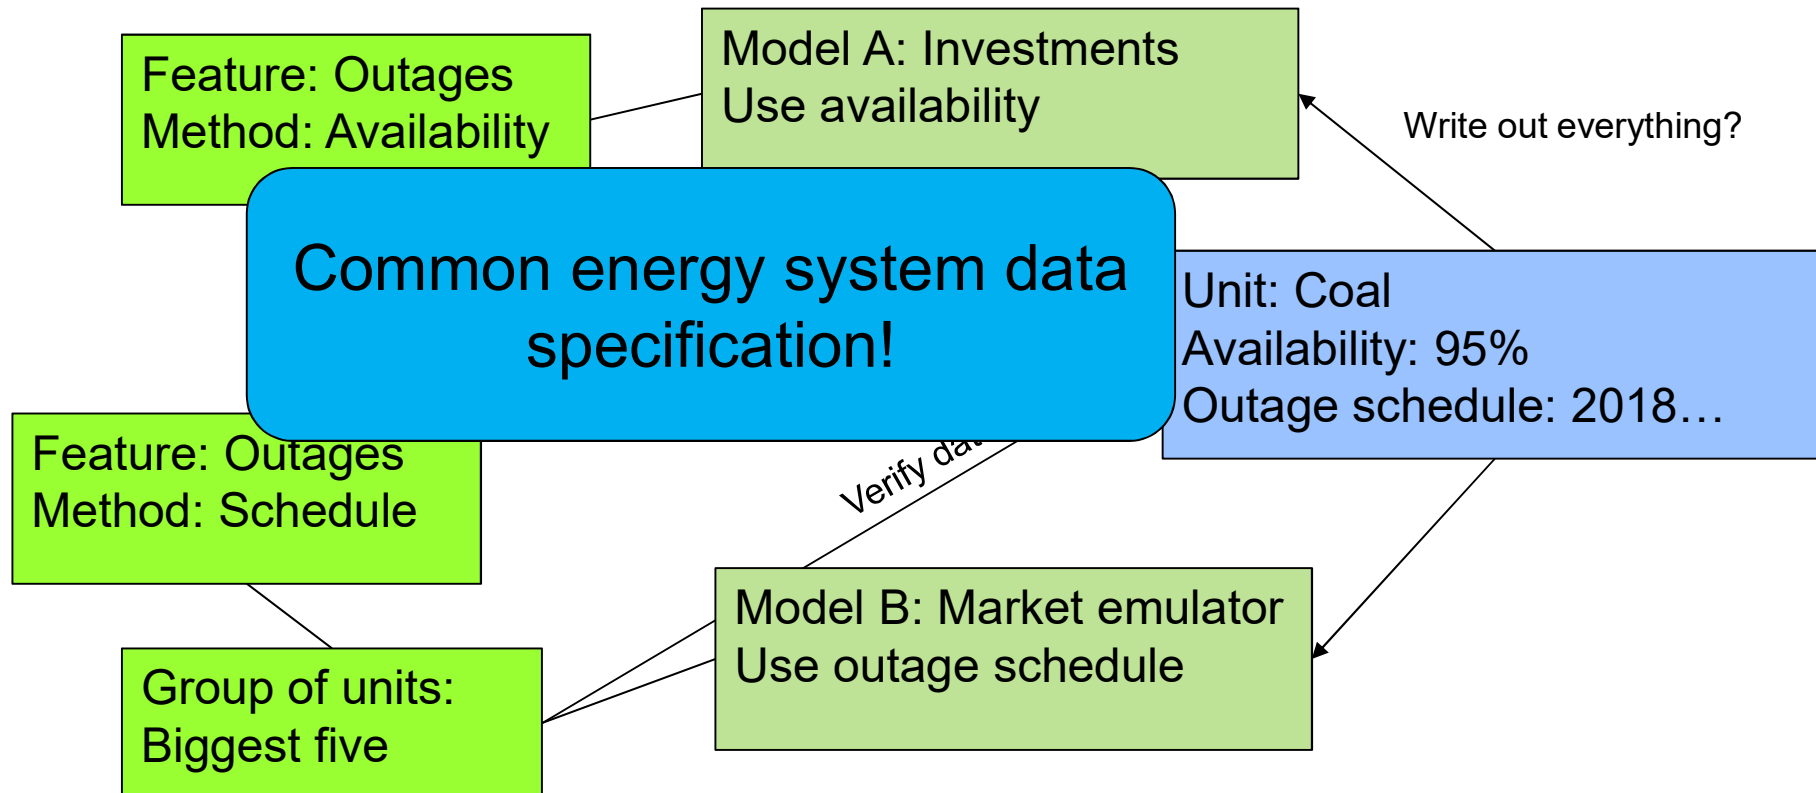

- Objects
 - Regular
 - Template (relationships could also have templates)
 - Archetype (relationships could also have archetypes)
 - Scenario
 - Tool
- Relationships
 - Dimensional sets
 - Groups / Collections
 - 'Bags' (single object can appear multiple times)
 - Hierarchical
 - Composition
 - Connection (arc in a graph)
- Entities with external reference
- Entities with code

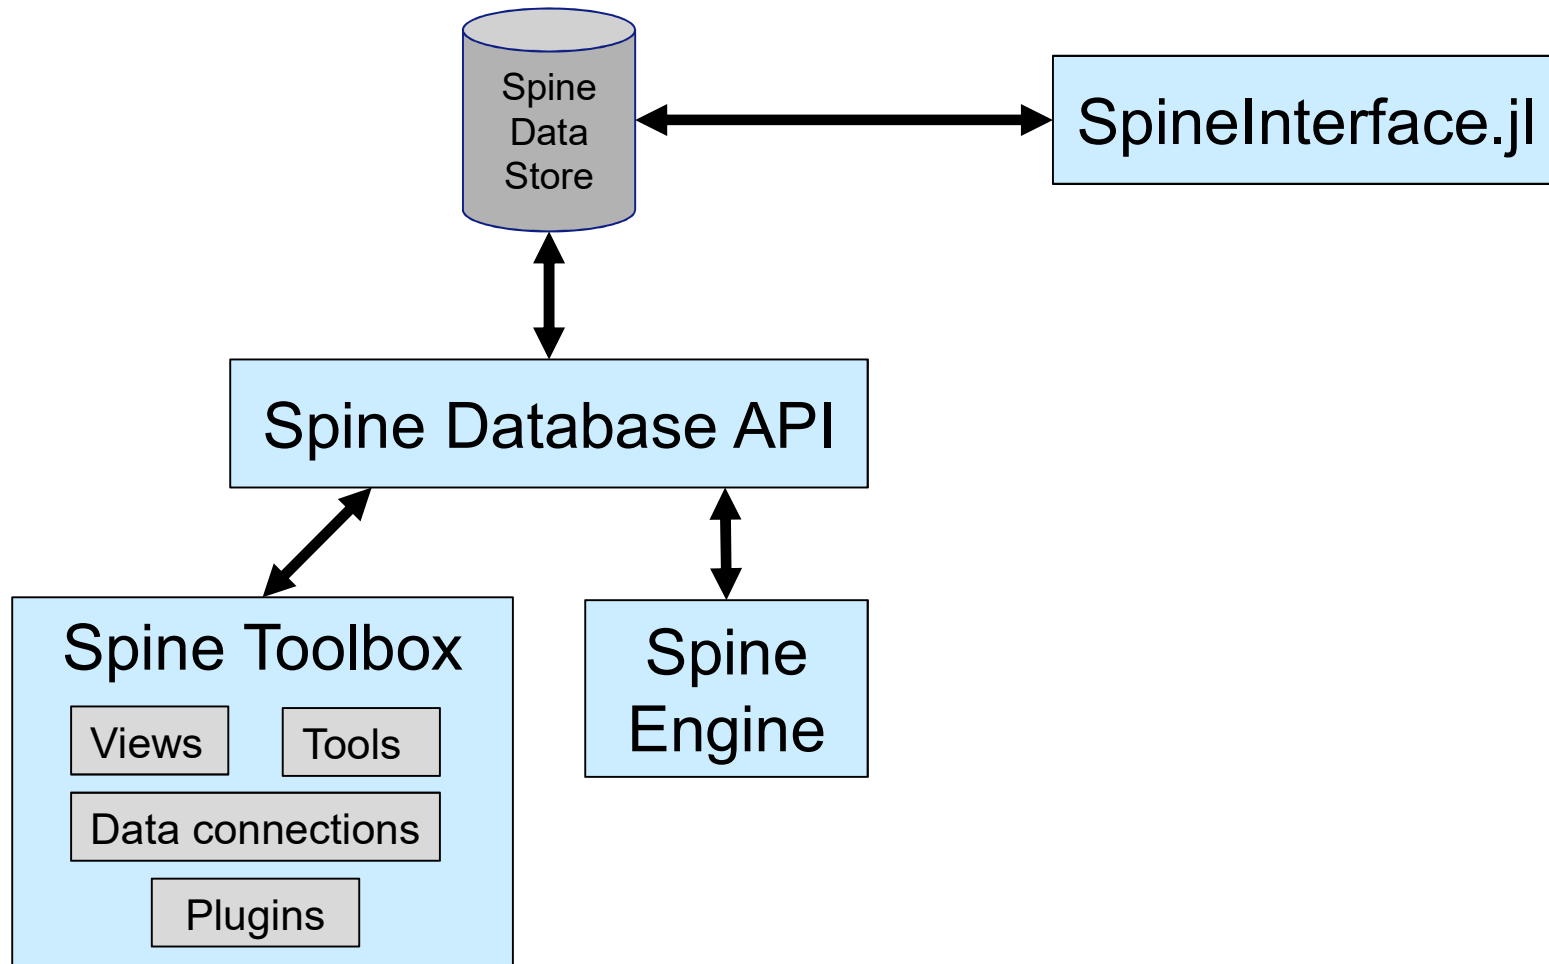

Metadata and commit messages

- Automatic metadata from tools/models that process data
- User can also input metadata
- Follow best metadata practices
- Commits
 - Push users to improve documentation
 - Changes to the database will be accompanied by a commit message
 - Logs time and user, but hopefully also a helpful message about the data edits in that session

Many tools and models, but one data set?

Model specific mapping of data (names, computations, flags, structures)

Philosophical notes

- Try to use the generic data structure as far as reasonable
- Don't allow screw ups
 - Data validation
 - Explicit selection
 - Archetypes – features – methods
- Open interfaces – can grow and accommodate new things
 - Databases through SQLAlchemy (db agnostic)
 - Direct connection to Julia/JuMP (Spine Model)
 - Plug-in infrastructure
